

Product: **Albina**

Protected

Key Benefits:

- Firmness
- Increased flower and fruit setting
- Extended post-harvest shelf life
- Reduced physiological disorders
- Reduced susceptibility to disease

Product: **Albina**

Technical Data:

Albina works by stimulating absorption of Calcium into tissues which conventional fertilisers cannot penetrate. Levity have created pioneering technology which supports the plants natural processes to enable Calcium absorption when a plants natural system is unable.

Why is Calcium Important?

Calcium gives strength to cell walls, protecting them from infection. Calcium stabilises the 'glue' that holds cells together, giving firmness. Calcium is needed to create new cells when fruit and flowers are setting. Calcium is used by the plant to protect against stress. Calcium in cell tissue prevents physiological disorders.

Application rate: 1-2 L/ha foliar spray at 14-day intervals.

EC FERTILISER C.1.5:

10% Nitrogen (N) (10% Nitrate N)
12% Calcium (Ca) 17% (CaO)
1% Zinc (Zn) w/w
